	4.4 func.js	42-44

1.0 Development Progress

We are required to build a single page website for a subject that we have studied, and we chose CST131, Computer Organization. The website must contain at least three topics, including some images and a section of our group information. We use HTML, CSS, Javascript and PHP to build these websites.

Our progress in designing the website is shown in Figure 1:

Figure 1. Website Development Progress

2.0 Design, Functionality and Content

2.1 Design of Website

2.1.1 Design Wireframe

Wireframe needs to be designed before the website is built. A wireframe in design process is lining the architectural blueprint that provides a clear vision of the website structure. We designed wireframe as the layout of content and functionality of the website we want to build.

Header	
Video	Title (description)
Slide 1	
Slide 2	
Slide 3	
<p>About Us</p> <div> <div></div> <div></div> <div></div> <div></div> <div></div> </div>	
Footer	

Figure 2. Wireframe of the webpage.

Figure 2 shows the wireframe we designed with the five sections in the webpages (three sections for the topics, one section for main and another one is About Us section). Navigation button is provided in the header for user to select it. User will be linked to the specific section selected without the need for user to scroll until the end. This greatly improves user experience. Other than, some images are included in the webpage that will help draw attention and guide the user's line of sight. In addition, images will make user engage more with the content.

At the description section, we describe the topic of the subject that we chose. Then, About Us section will show the user the members of the developer team including name and picture. Lastly, footer contains the copyright of the webpage.

2.1.2 Structure Website using HTML

To build the website, we used HTML to define the page layout and elements within the page after the wireframe design. The elements include the text and images needed as the webpage design.

2.1.3 Add CSS

Then, we will move to CSS to style the website which describes the HTML elements to be displayed on screen. We used external CSS which is easy for us to find, modify the colour, layout of the website, font, button and image. The image and content for each section are aligned.

2.1.4 Add JavaScript

We have also added JavaScript to add some animation, which is a slider to the website. The table below shows the function description in the JavaScript.

Function Name	Description
plusSlides()	To control the slide to next or previous slide.
currentSlides()	To show the current slide that user wants to see.
showSlides()	To show the slide.

Table 1. Functions in JavaScript

2.1.5 PHP

PHP is added to improve the functionality of the login function. When the user clicks the login button, a login pop-up will be shown. User can login by entering their username and password. Once login, the login button will change to user's username to prove that the user has successfully logged in. User can log out by clicking "log out" button that is located below the user's username.

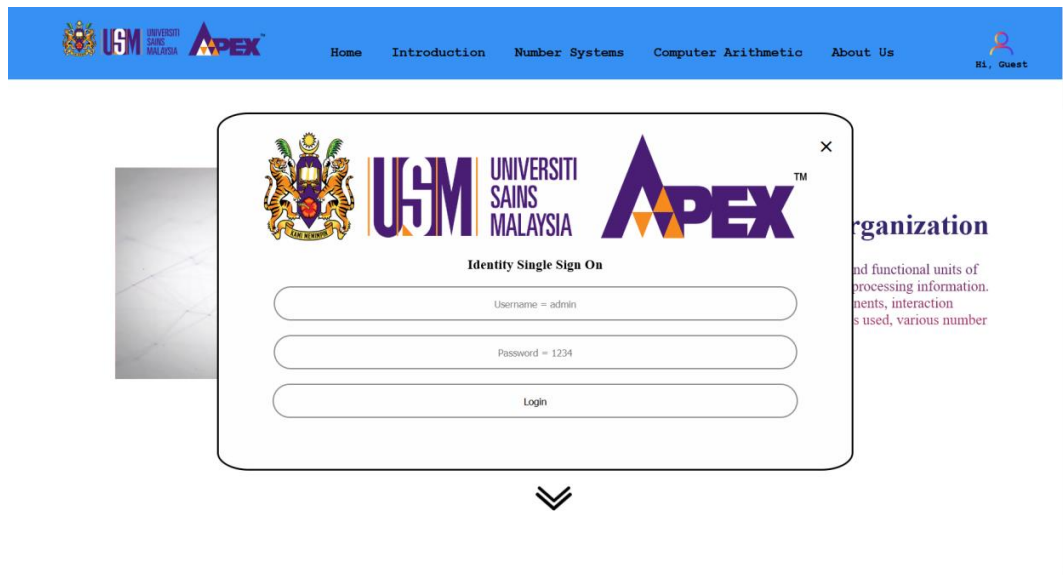

Figure 3. Login pop up

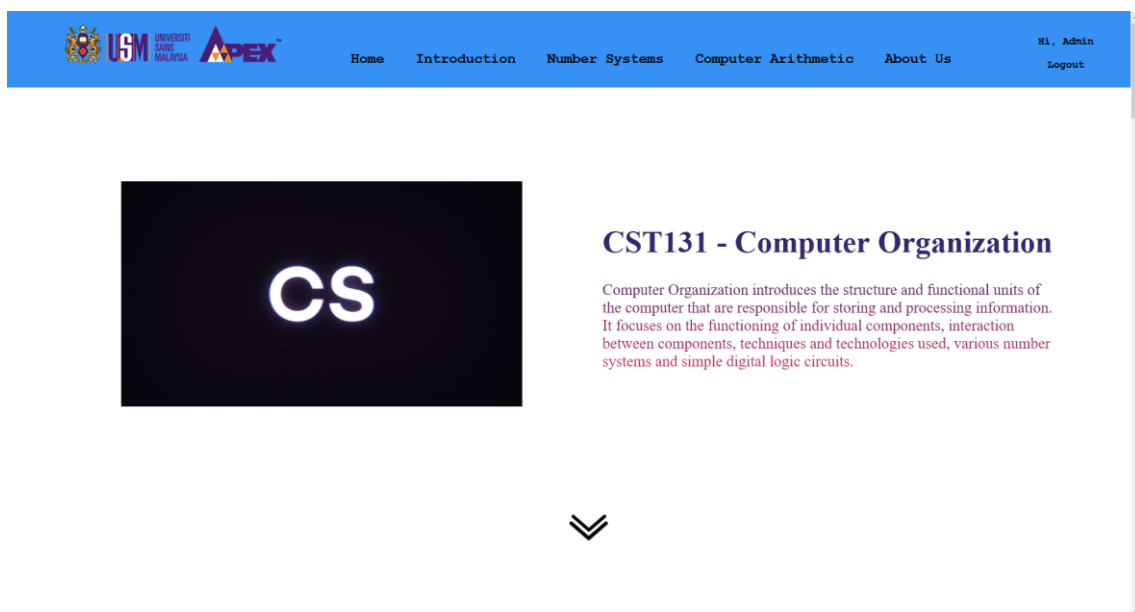

Figure 4. User can log out by clicking “log out” button below the username

2.2 Functionality

Some of the functionalities of the website are:

- a. New users can sign up while existing users can log in and log out.

- b. User can choose the content of subject section by clicking the section at the top of the page.
- c. User can directly go to “About Us” section by clicking the “About Us” button that is located near the login button.
- d. User can see the name and matric number of the team member by moving the mouse to the image of the selected team member.

2.3 Content of the Website

The content of the web page is shown as below. The main title of our single website is “CST131-Computer Organization”, a subject we took during Year 1. There are five sections in our website page. One for home, three for content and one for “About Us”.

2.3.1 Home Section

For home section, we have included a muted video and some explanations about the subject:

- Computer Organization introduces the structure and functional units of the computer that are responsible for storing and processing information. It focuses on the functioning of individual components, interaction between components, techniques and technologies used, various number systems and simple digital logic circuits.

2.3.2 Content of subject Section

There are three sections that we include for content to describe the Computer Organization subject:

1. Introduction

- Architecture and Organization
- Structure and Function
- Main Computer Structure
- Main CPU Structure
- Main Functions of a Computer
- Cloud Computing
- Performance Assessment

2. Number Systems

- Decimal Systems
- Binary Systems
- Character Code

3. Computer Arithmetic

- Integer Representation
- Two's Complement
- Addition and Subtraction
- Multiplication
- Division

2.3.3 About us Section

There will be a section called “About Us” as the last section of our web page. The picture of our team is included. If the user’s cursor is moved to the picture, it will show the member’s description, which are the name and matric number.
